

ADN 2.0 " Staging Ready "

The ADN services that you offer need to be modified and updated frequently and you would like to be able to visualise, test and update them on your LAN before making them available to your partners.

This procedure can be very time and energy consuming (and therefore expensive) if the tools that you are using cannot handle automatically the updating and implementation of new and existing services.

ADN 2.0 offers you precisely these types of services.

Thanks to a series of simple commands you can update your services in a matter of seconds. This update includes the totality of the information necessary, not only of the configuration data but also the binary codes of your ADN services.

ADN 2.0 offers this preproduction functionality inherently which means that by simply putting in place a new ADN licence you can benefit from this facility, without having to effect any further modifications.
